

How to Prevent Cheating on a Quiz

We have various features to help you control cheating:

1. [Question Pooling](#)

Select questions from a pool at random, so each person gets a different quiz.

2. [Randomize Question Display](#)

Shuffle the questions, so the questions are never presented in the same order. It ensures that two quiz takers sitting side by side would not get the same order of questions.

3. [Shuffle the answer options inside a question](#)

For added security, you can even shuffle the answer option such that options (such as A, B, C, D in [multiple choice](#) questions) are not always in the same order when a question is presented. That way no one can take an answer key from another student.

4. [Add a Time limit](#)

Add a time limit, so students only have enough time to finish a test and not enough to find answers from books, internet, etc.

In addition to the above these four options there are other ways in which you can [prevent cheating in online assessments](#).
